

Requirements Management with Use Cases

This PMI approved, two-day course takes an in-depth look at requirements management using the Use Case technique. This course will help attendees gain knowledge direct experience around requirements management activities. Students will learn how to manage individual requirement artifacts and understand how requirements fit within the Rational Unified Process (RUP). Students will gain insight into the application of customizations and apply this knowledge to the requirements process specific to their organization.

Who should attend?

This course is designed for project managers, system and business analysts, developers, and testers.

After completing the course, learners will be able to:

- Gain knowledge of, and direct experience with, requirements management activities
- Learn how to manage individual requirement artifacts
- Understand how requirements fit within the Rational Unified Process (RUP)
- Gain insight into applying customizations to the requirements process specific to your organization
- Understand guidelines and techniques for capturing functional requirements and system requirements
- Acquire skills (through classroom exercises) to effectively document requirements with a specific concentration on use case analysis
- Learn when to utilize traceability and tools to automate time-consuming processes
- Successfully execute requirements management
- Successfully elicit requirements
- Specify requirements
- Validate requirements
- Manage evolving requirements
- Tailor the requirements approach
